BACPro LLC Launches Monitoring and Reporting Tool for BACnet® Networks

Making sure your building control system runs seamlessly—all day, every day

BACPro LLC has officially launched their industry-leading network analysis tool, BACPro™, which provides unrestricted live monitoring, analysis of offline captures, and comprehensive reporting to help building operators manage complex BACnet® networks.

In Live Monitoring mode, BACPro listens 24/7 to every packet to and from your building automation workstation—and then reports discovered anomalies. All issues are tagged by level of severity. BACPro can also send SMS notifications when it finds severe anomalies such as duplicate BBMDs, and device, workstation, and network failures.

In Offline Capture File Processing mode, BACPro can import any BACnet IPv4, IPv6, or MSTP capture file and generate a comprehensive report for each.

Regardless of mode, BACPro provides three useful scores for your network's condition: connectivity, performance, and integrity. The connectivity score shows the percentage of all your devices that are communicating correctly on the network. The performance score shows how fast devices respond to requests, and the integrity score shows how many configuration or communication problems are detected. The overall rating shows the state of the entire BACnet network—a useful metric to guide troubleshooting activities.

BACPro LLC was founded to provide expert analysis for BACnet® networks. With decades of combined BACnet experience, our team developed BACPro™ to be easy to use and to help you spend less time troubleshooting complex network traffic issues and problematic devices. We are committed to helping you address BACnet problems before your customers are even aware of them. In short, we believe that your building network should run seamlessly—all day, every day.
